

A modern and powerful dataplatform? Combine your datawarehouse with a datastore

At Kohera we strongly believe that you can't get the most out of your datawarehouse without implementing a datastore as an in-between. So when modernising a datawarehouse, we also recommend a datastore, for you to obtain optimal insights in your data.

WHY MODERNISE YOUR DATAWAREHOUSE?

With the launch of SQL Server 2016 there are a lot of new possibilities in datawarehousing, such as faster operations, better columnstore indexes, improved reporting and analysis services, ... Thanks to those integrated functionalities, the storage and retrieval of data goes much faster and users need less disc space. The source system of the datawarehouse has to manage a lot of data. To do that in

a structured and efficient manner, it's best to integrate a datastore.

WHY A DATASTORE?

A datastore is designed to integrate data from multiple sources, for additional operations on the data. It is a complementary element to a datawarehouse and is used for operational reporting, controls and decision making. You can only apply the datastore principles on SQL Server 2016 or newer versions.

A datastore keeps track of the history of all your data. That means you can feed your datawarehouse data from a period in the past. Without a datastore, it's very complex to find that older information. Also, if you want to migrate your ERP or CRM-system, you can use a datastore as the source for doing so in an efficient way. This creates great flexibility

and more options for the future of your company. Datastores also offer more possibilities for different types of users: powerusers can make reports in the datastore, without a helping hand from the IT department.

HOW WE CAN HELP YOU

If your SQL Server dates from before 2016, we recommend you to modernise your datawarehouse. In a five day long analysis, we start by looking into your source systems so we have a clear view on the setup for the datastore and datawarehouse. In the next step, we set up a BI roadmap based on your business requirements, so your business can fully enjoy the benefits of a modern datawarehouse in combination with a datastore.
